

INTREPID – WG2

Achieving critical mass of attention
and focused action
to improve the practice of
inter- and trans-disciplinary research

Goals

- **COST TD 1408:** To better understand how to achieve more efficient and effective interdisciplinary research in Europe as to strengthen our ability to address contemporary global (urban) challenges characterised by increasing complexity and uncertainty
- **WG2 – Building networks and cooperation:**
 - **GAPG 7:** Drawing together researchers who have worked on EU, national and private funded research (on urban issues), so as to build on past investments and experience, deriving new insights.
 - **GAPG 8:** Connect research and funding communities using different languages and methods, overcoming common obstacles to the operationalisation of interdisciplinarity and sustainability – focusing on the key theme urban development.
 - **GAPG 9:** Build an interdisciplinary group of scientists that will promote self reflection, shared learning, stimulate discussion, with the aim of deepening understanding of the opportunities and obstacles affecting access to funding and research practice.

CONCEPTS

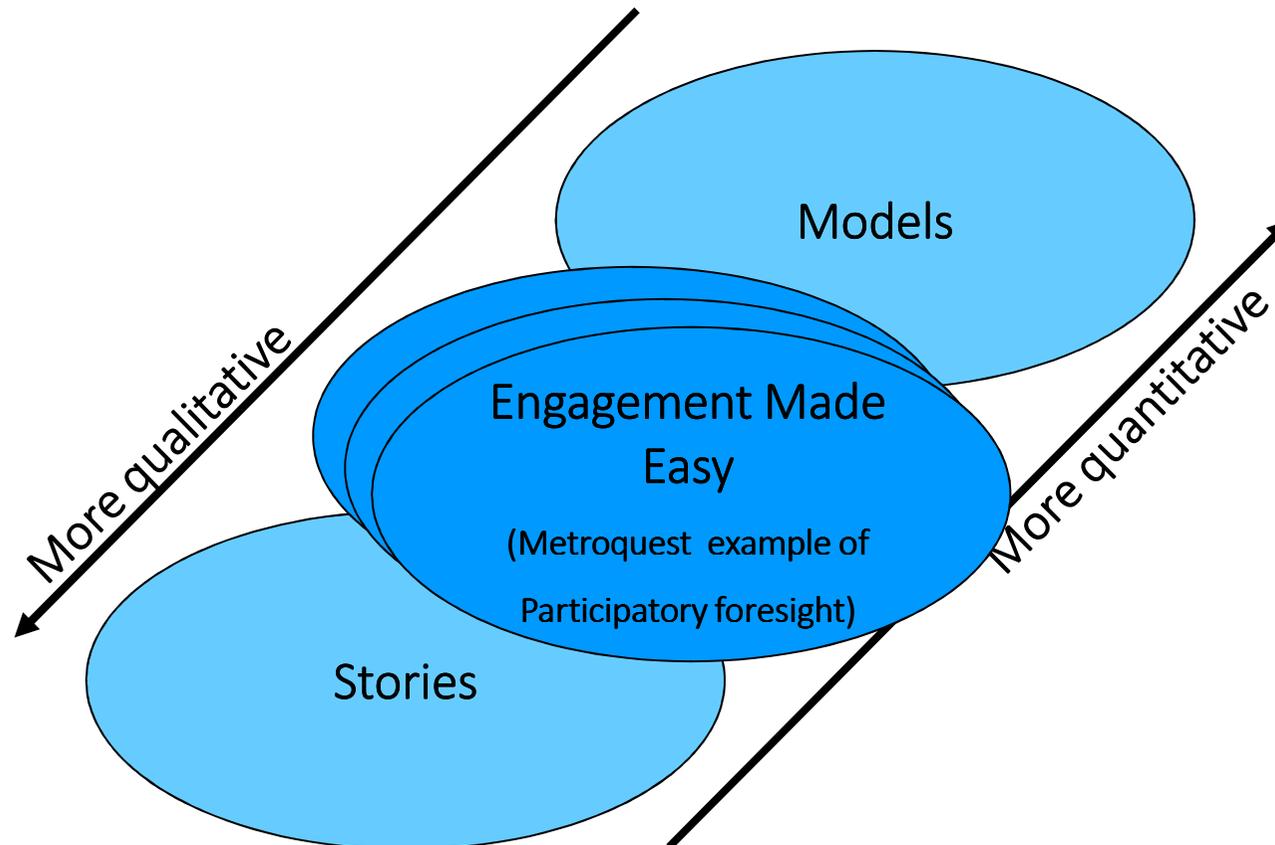

(from WG1 and other sources)

- Foresight
- Sustainability, co-creation, engagement
- Inter- and trans-disciplinarity
- Responsible Research & Innovation (RRI)

Key characteristics of issue-driven foresight studies

- A. Problem-focused
- B. Reflexive (systemic integration of disciplinary perspectives)
- C. Open and inclusive (mutual understanding and co-creation of knowledge with end-users, stakeholders)
- D. Future Oriented (anticipatory)

Models, stories and scenarios

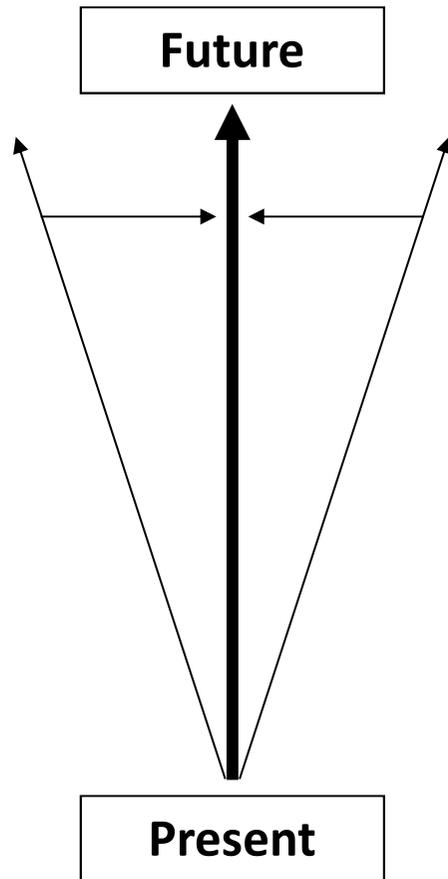

(adapted from Robinson, 2015)

Foresight is ..

- Beyond predictive forecasting
- Exploring a plurality of possible scenarios
- Can be complemented with backcasting to deliver policy advice and roadmaps to desirable futures

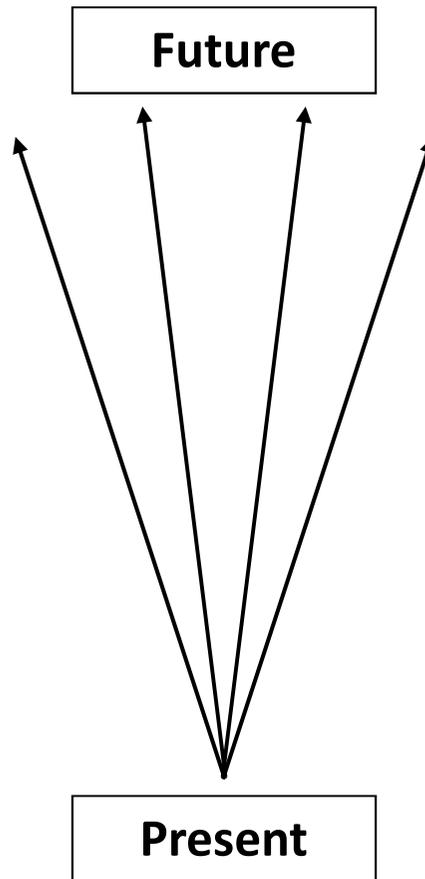

Forecasting

Predict most likely future

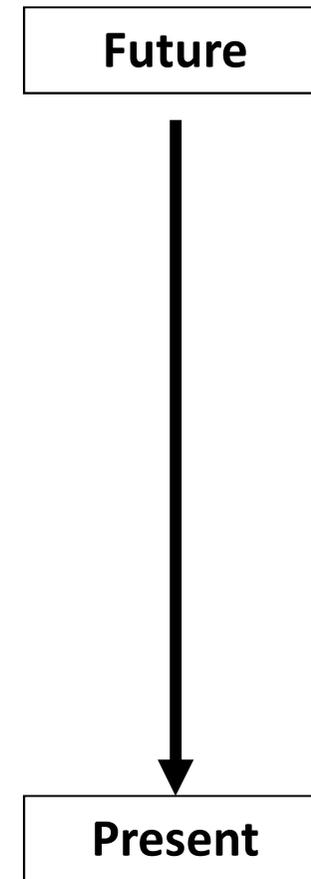

Scenarios

Explore alternative futures

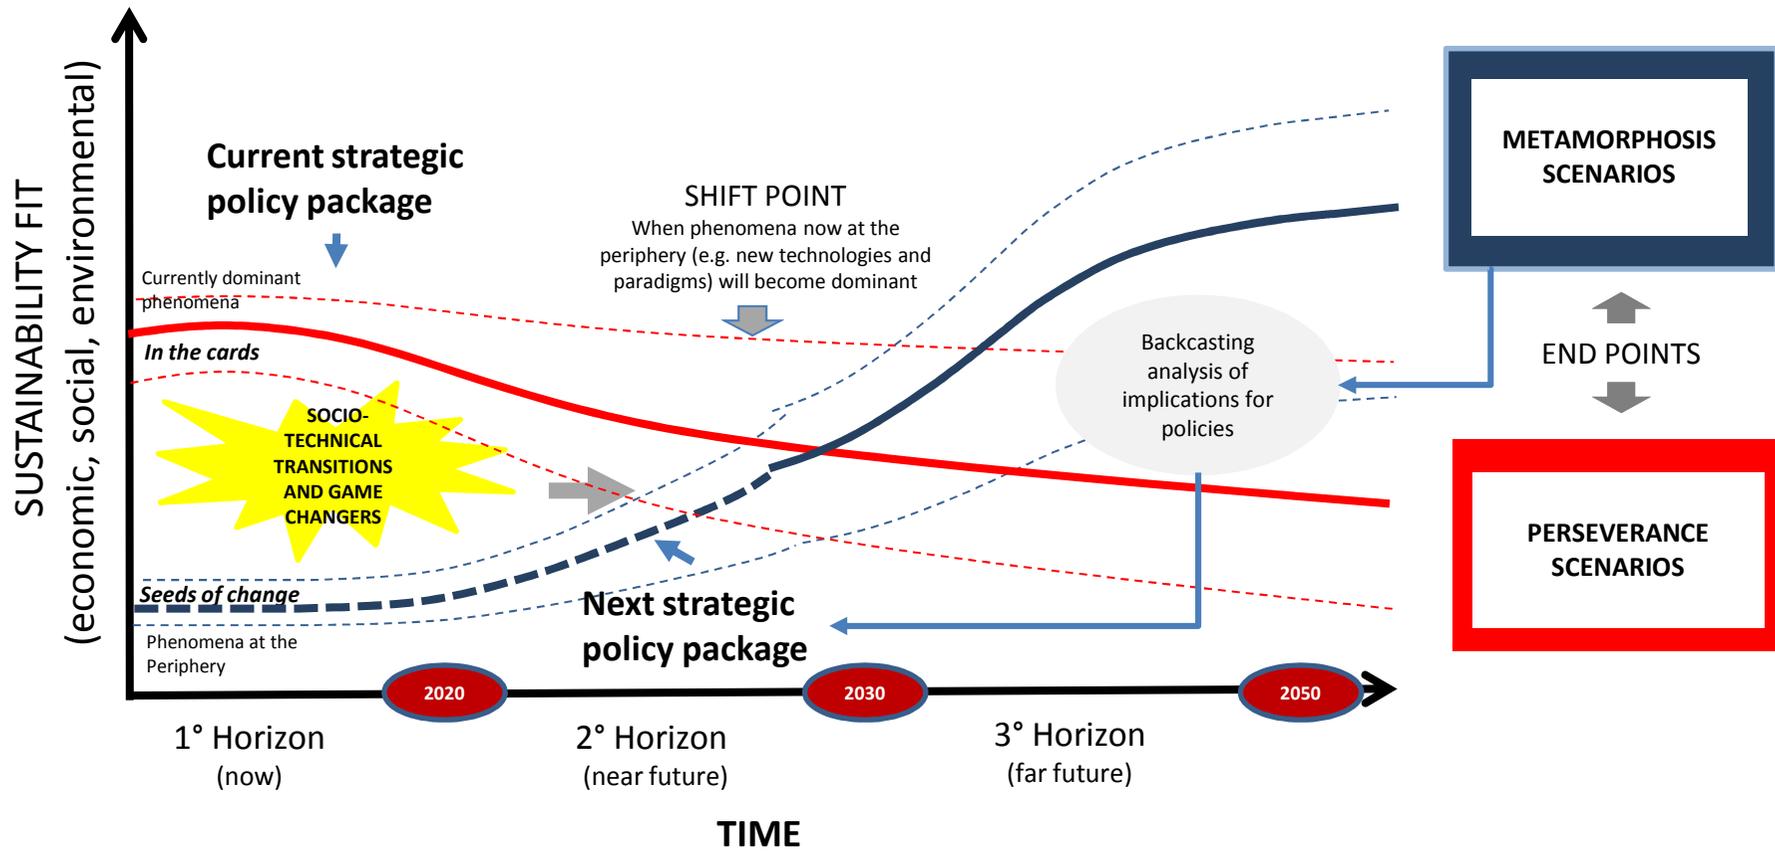

Backcasting

Assess feasibility of desirable future

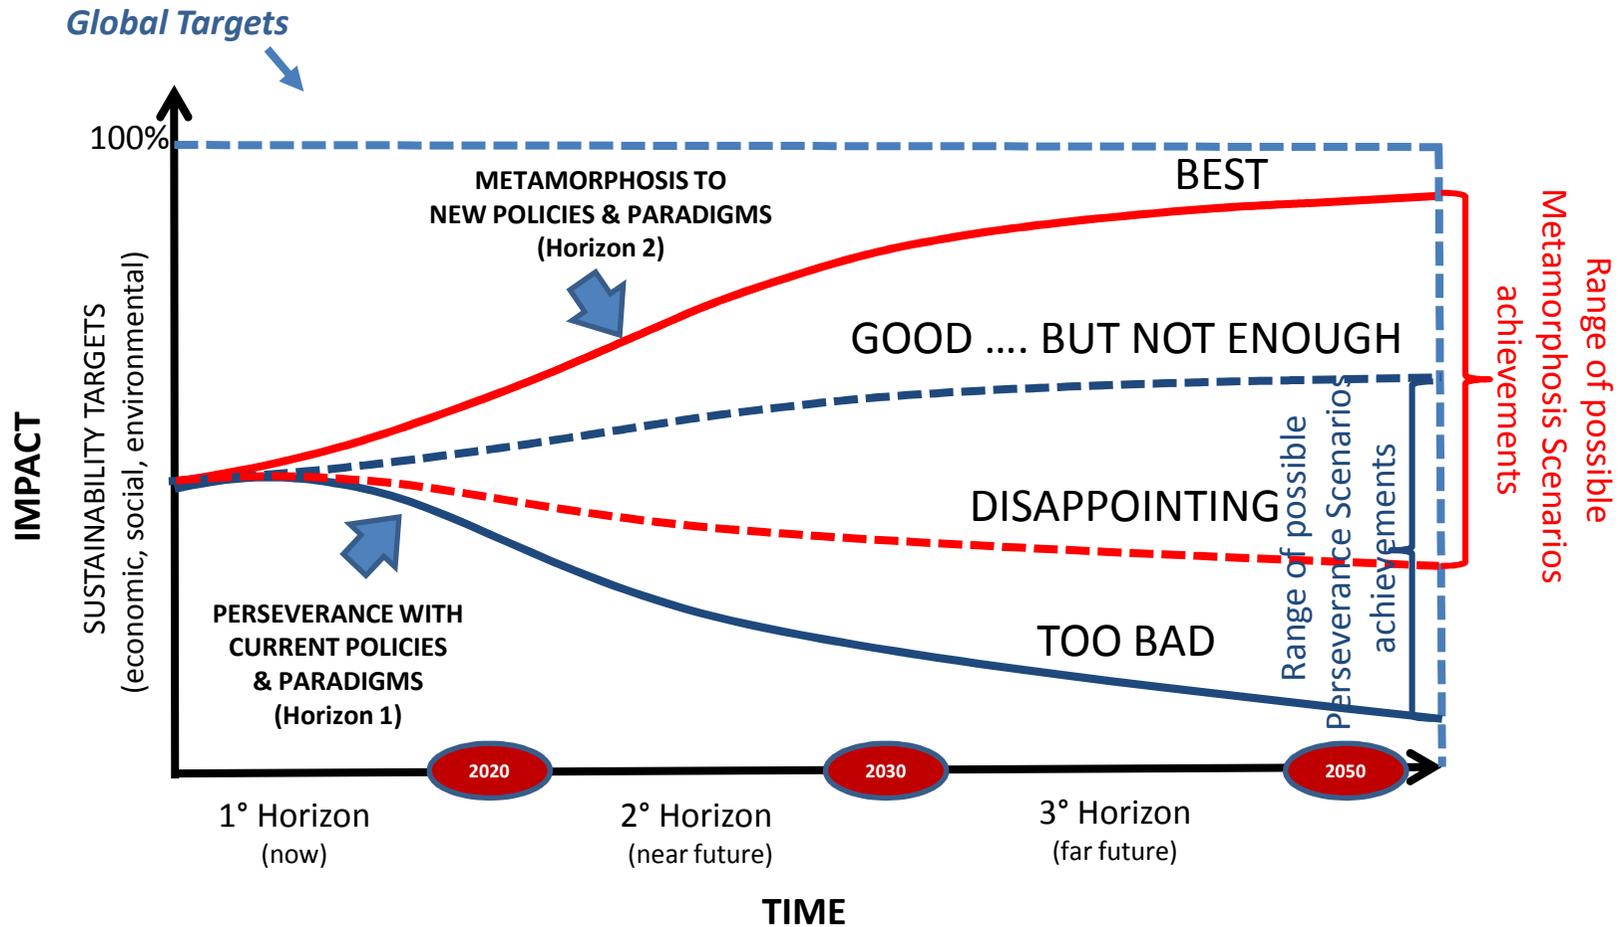

(Robinson, 2015)

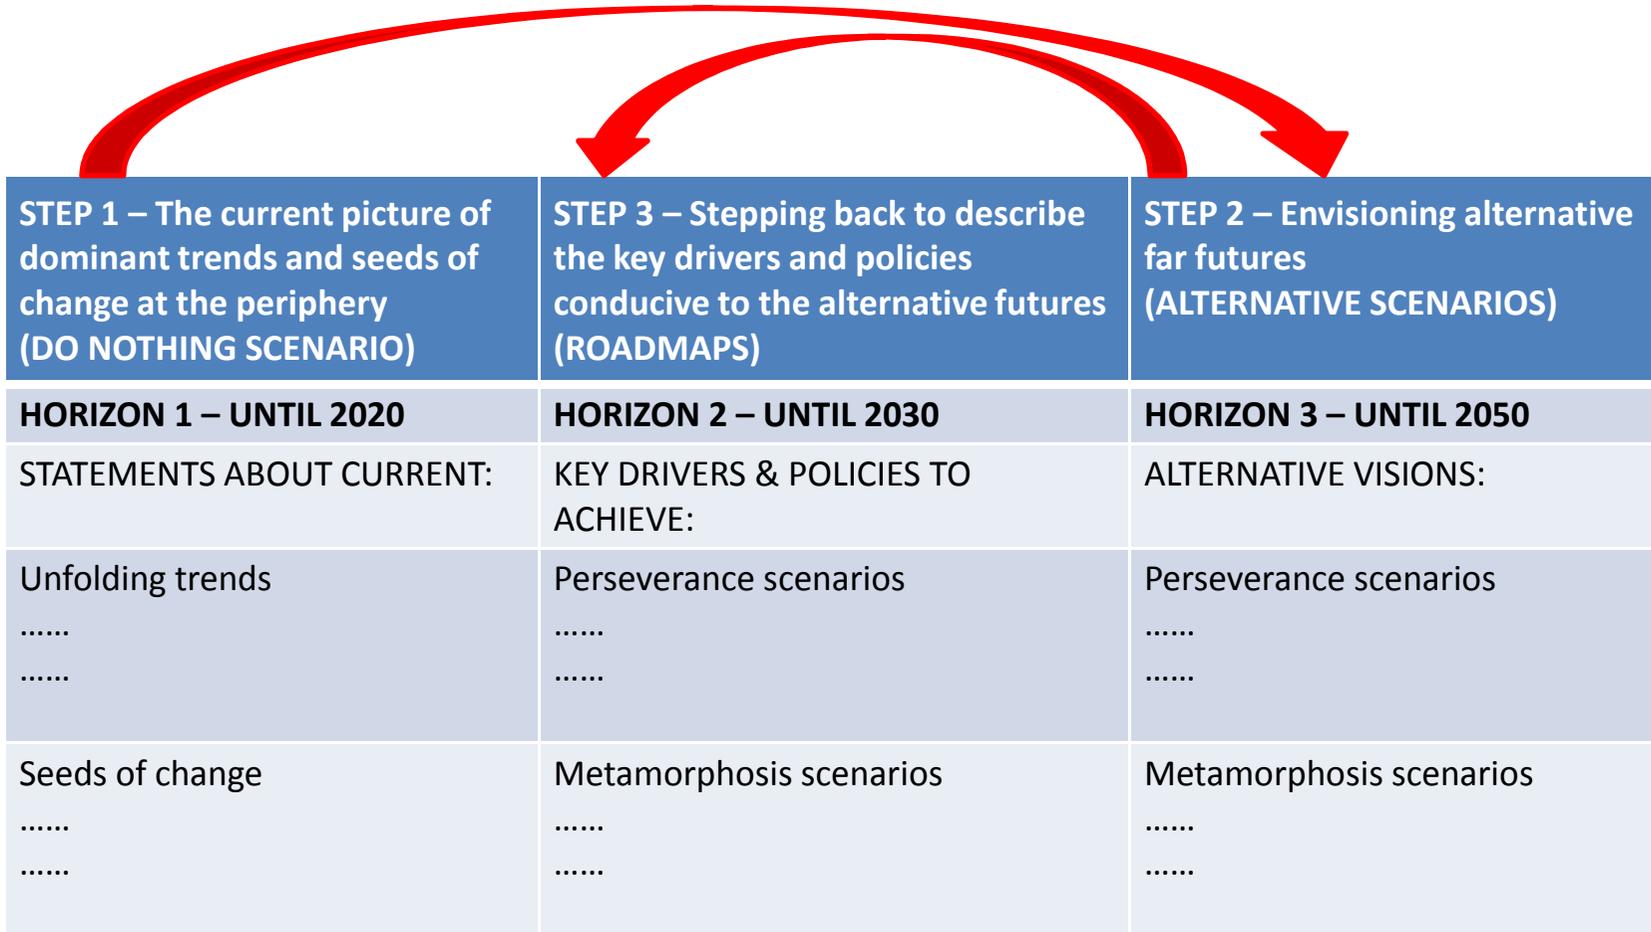

FORWARD LOOKING FRAMEWORK – THREE HORIZONS MODEL PLOT

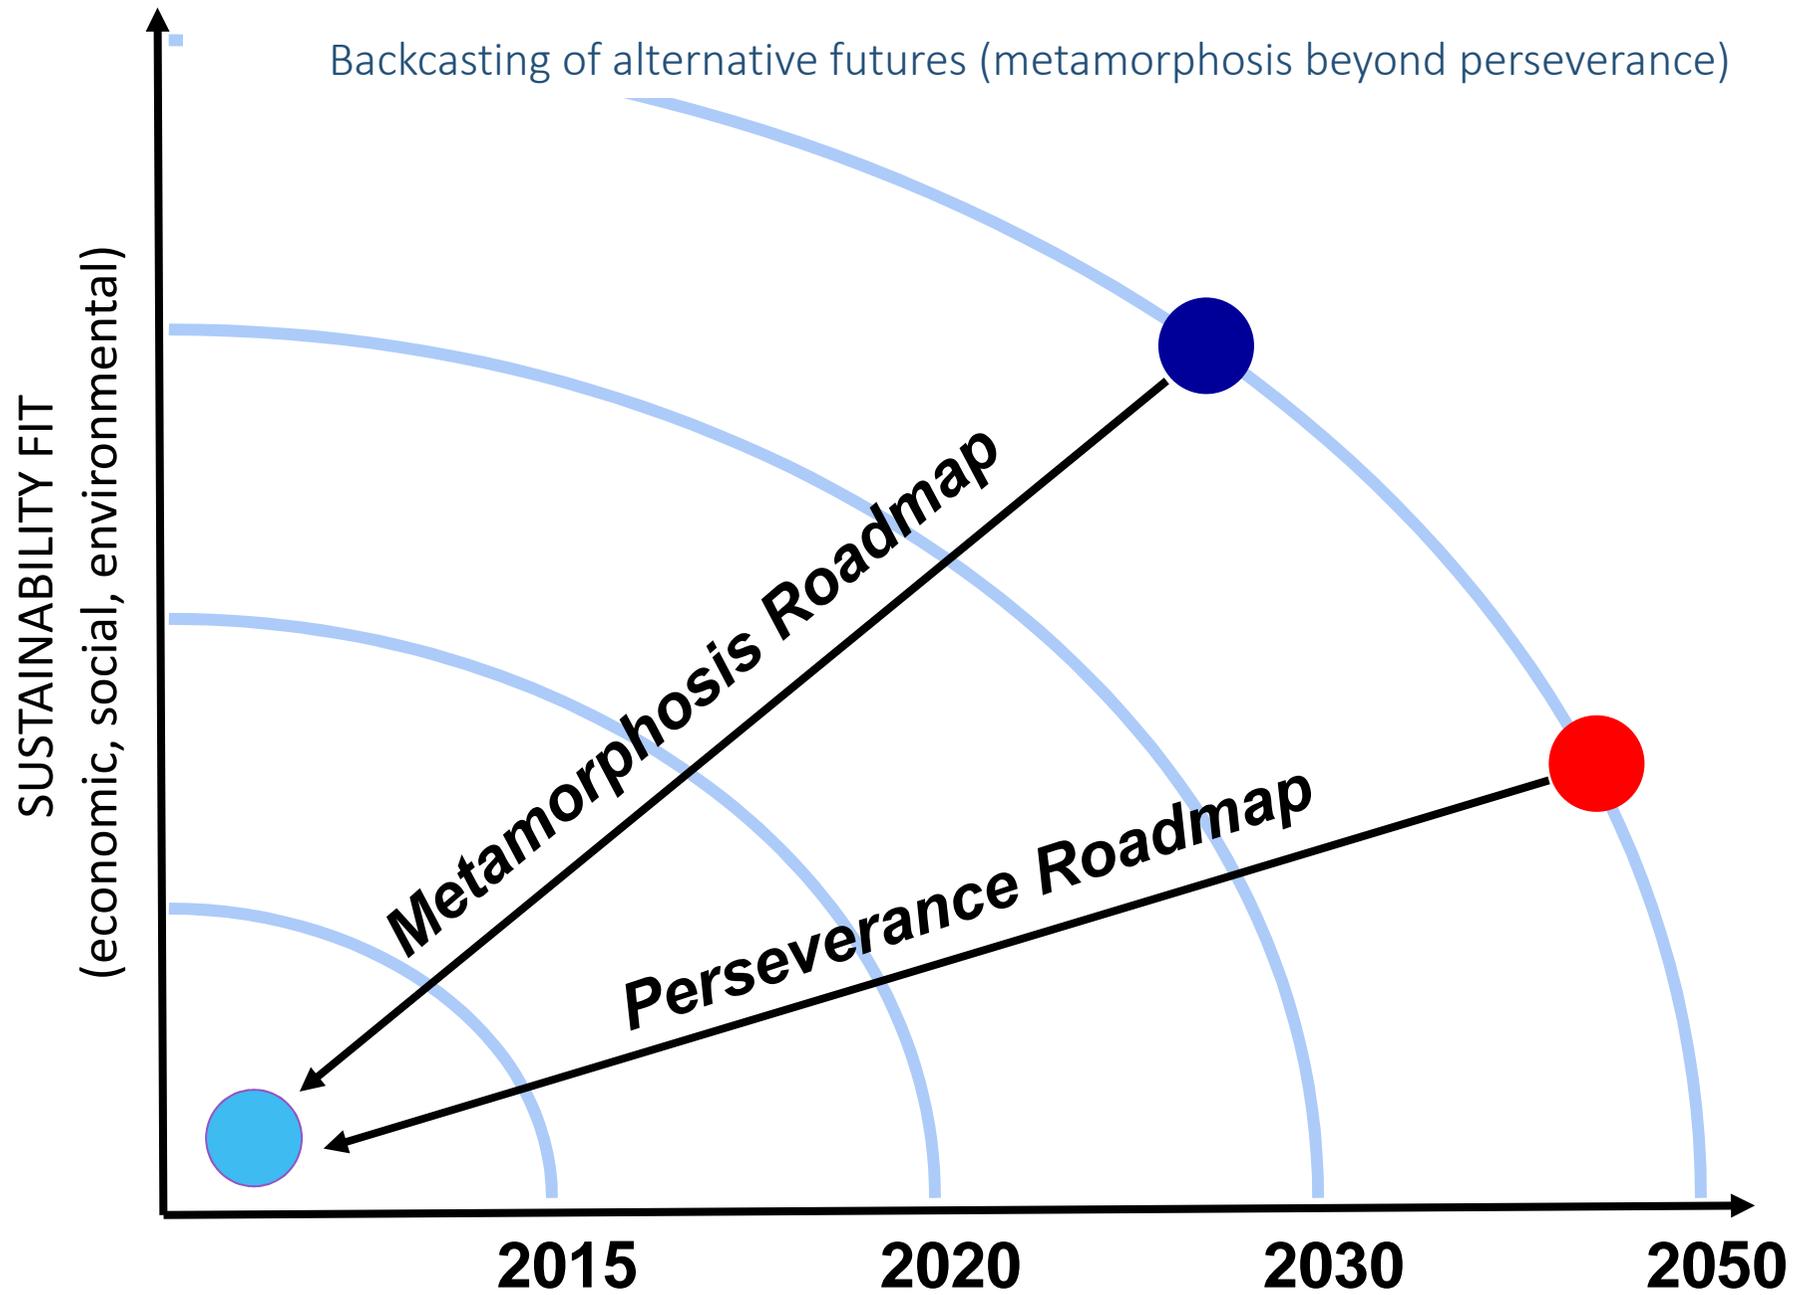

SCENARIOS IMPACT PLOT (global targets achievement)

SCENARIO BUILDING STEPS

Challenges of the foresight approach

- User control of scenarios
 - Who educates whom? (“wrong choices”)
- Tools vs. processes
 - From tool → interface → processes of use
- Addressing larger context vs. local issues
 - Users want local applicability
- Visioning vs. planning uses
- Accessibility (availability of time and technology)
- Limits of purely cognitive approaches
- Time and cost

(Robinson, 2015)

Move towards a Transdisciplinary Foresight Agenda

- Explore the implications for **sustainability** of strong forms of inter/transdisciplinarity
- Based on **knowledge co-creation** and the **engagement** of all actors in a participatory process

Sustainability as . . .

- a normative ethical principle
 - Strong political and moral dimensions
- an essentially contested concept
 - Like beauty, truth, justice, democracy . . .
- a world-making process
 - Choice of futures and roadmaps to implement those futures

(Robinson, 2015)

Sustainability

“[Sustainability] must be constructed through an essentially social process whereby scientific and other “expert” information is combined with the values, preferences, and beliefs of affected communities, to give rise to an emergent “co-produced” understanding of possibilities and preferred outcomes.”

(Robinson, 2004)

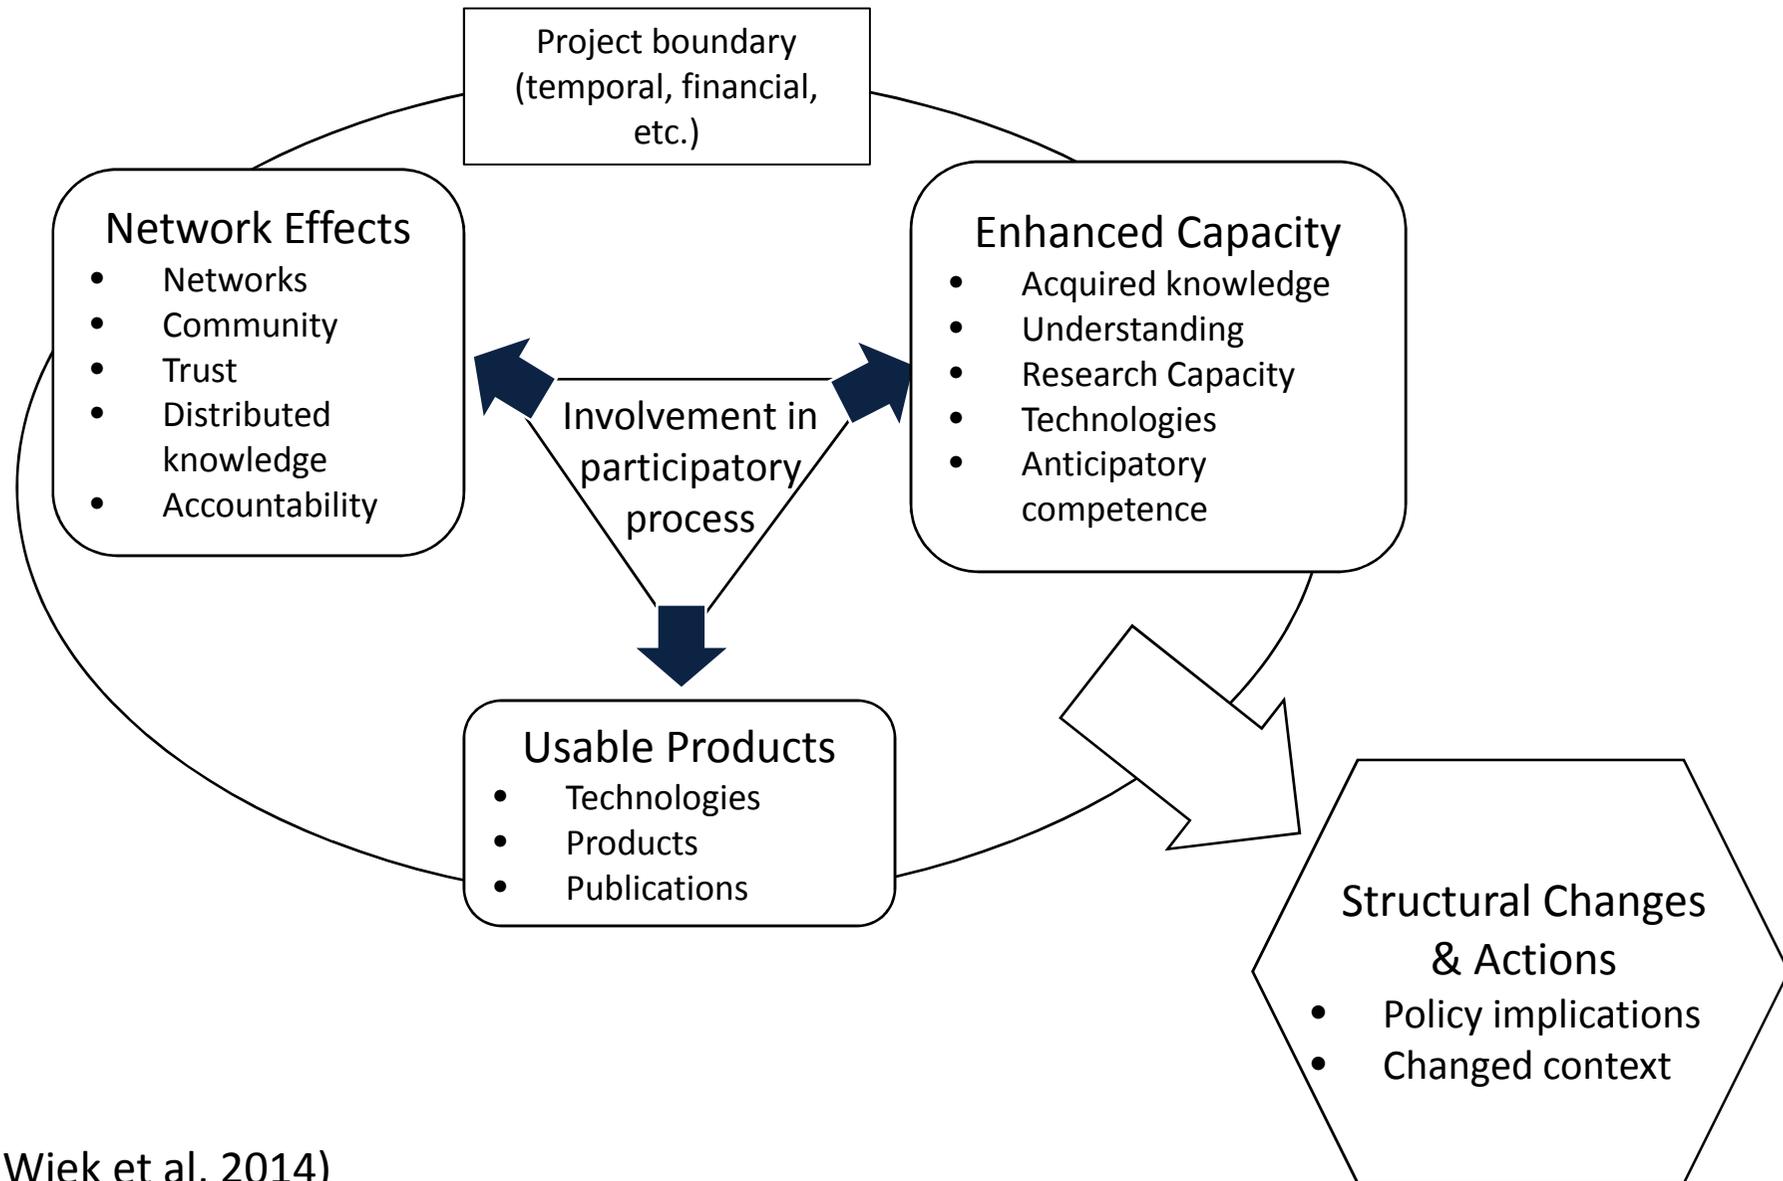

Co-creation

“Co-creation is an umbrella term that refers to collaborative approaches to knowledge production that draw upon interactive and participatory research methods for societal problem-solving.

. . . [It] focuses on bringing together research and practice, and creating joint processes and arenas for social learning between academic researchers, practicing professionals, end-users”

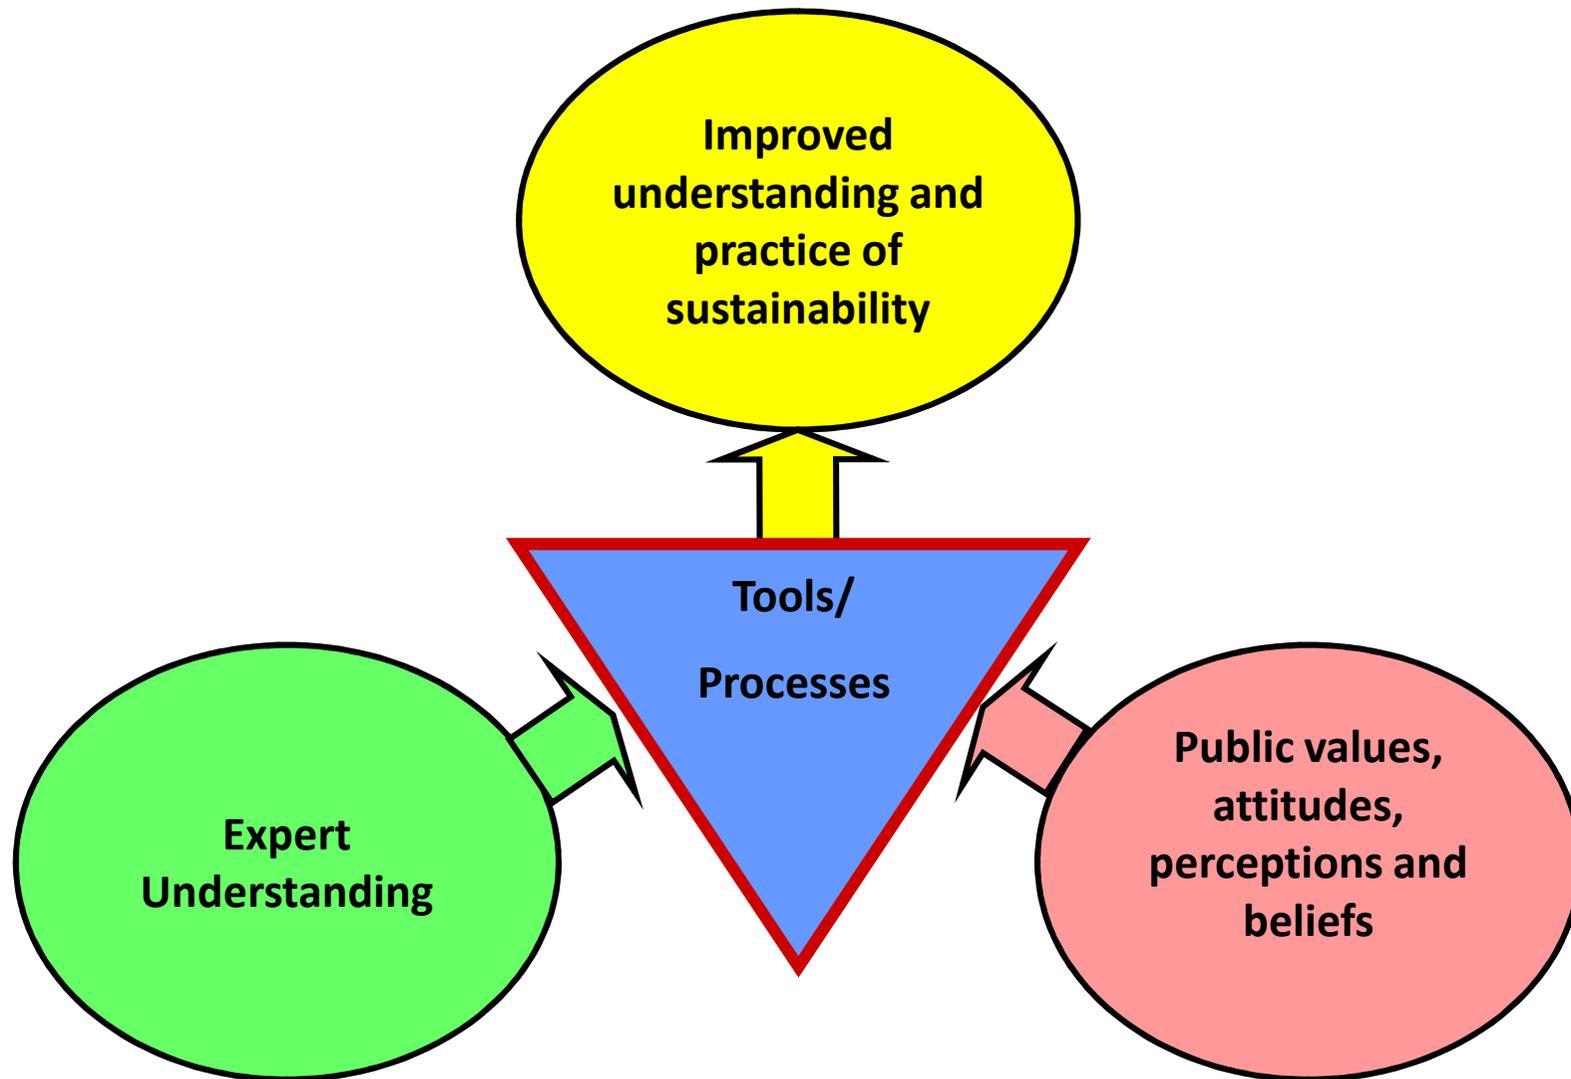

(adapted from Mistra Urban Futures, 2015, p. 35)

Societal Effect of Engagement

(Wiek et al, 2014)

Knowledge Synthesis

(Robinson, 2015)

INTER- AND TRANS-DISCIPLINARITY: OPERATIONAL DEFINITIONS FOR WG2 NETWORKING

INTERDISCIPLINARY RESEARCH is any study or group of studies undertaken by scholars from two or more distinct scientific disciplines. The research is based upon a conceptual model that links or integrates theoretical frameworks from those disciplines, uses study design and methodology that is not limited to any one field, and requires the use of perspectives and skills of the involved disciplines throughout multiple phases of the research process.

TRANSDISCIPLINARY RESEARCH is defined as research efforts conducted by investigators from different disciplines working jointly to create new conceptual, theoretical, methodological, and **translational innovations** that integrate and move beyond discipline-specific approaches to address a common problem.

Harvard, Mass. – School of Public Health

<http://www.hsph.harvard.edu/trec/about-us/definitions/>

TRANSLATIONAL RESEARCH: A CONCEPT BORN IN THE HEALTH SECTOR ...

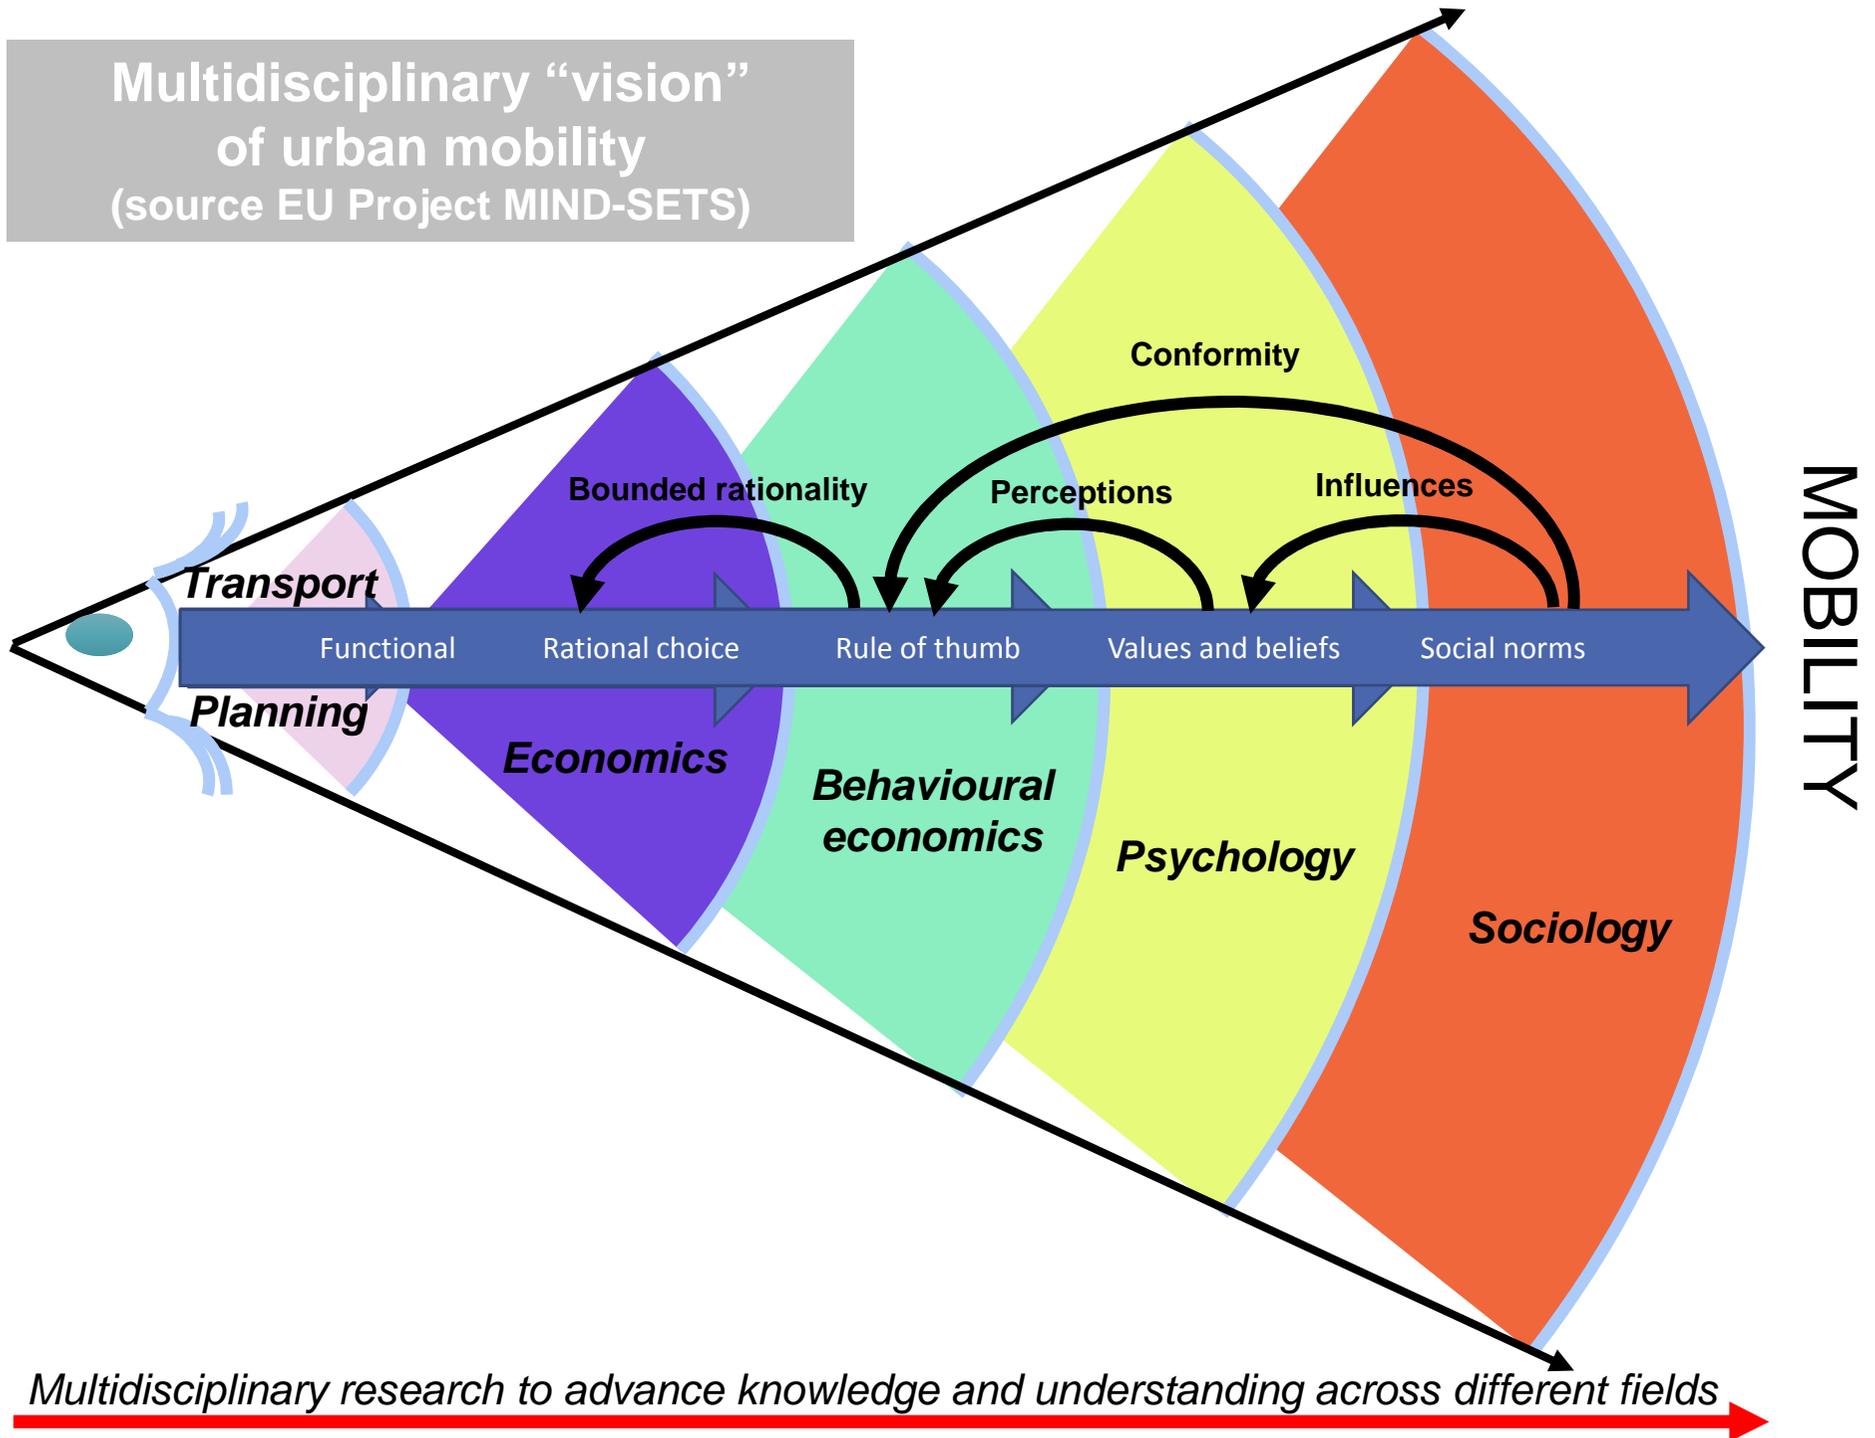

WIKIPEDIA: https://en.wikipedia.org/wiki/Translational_research

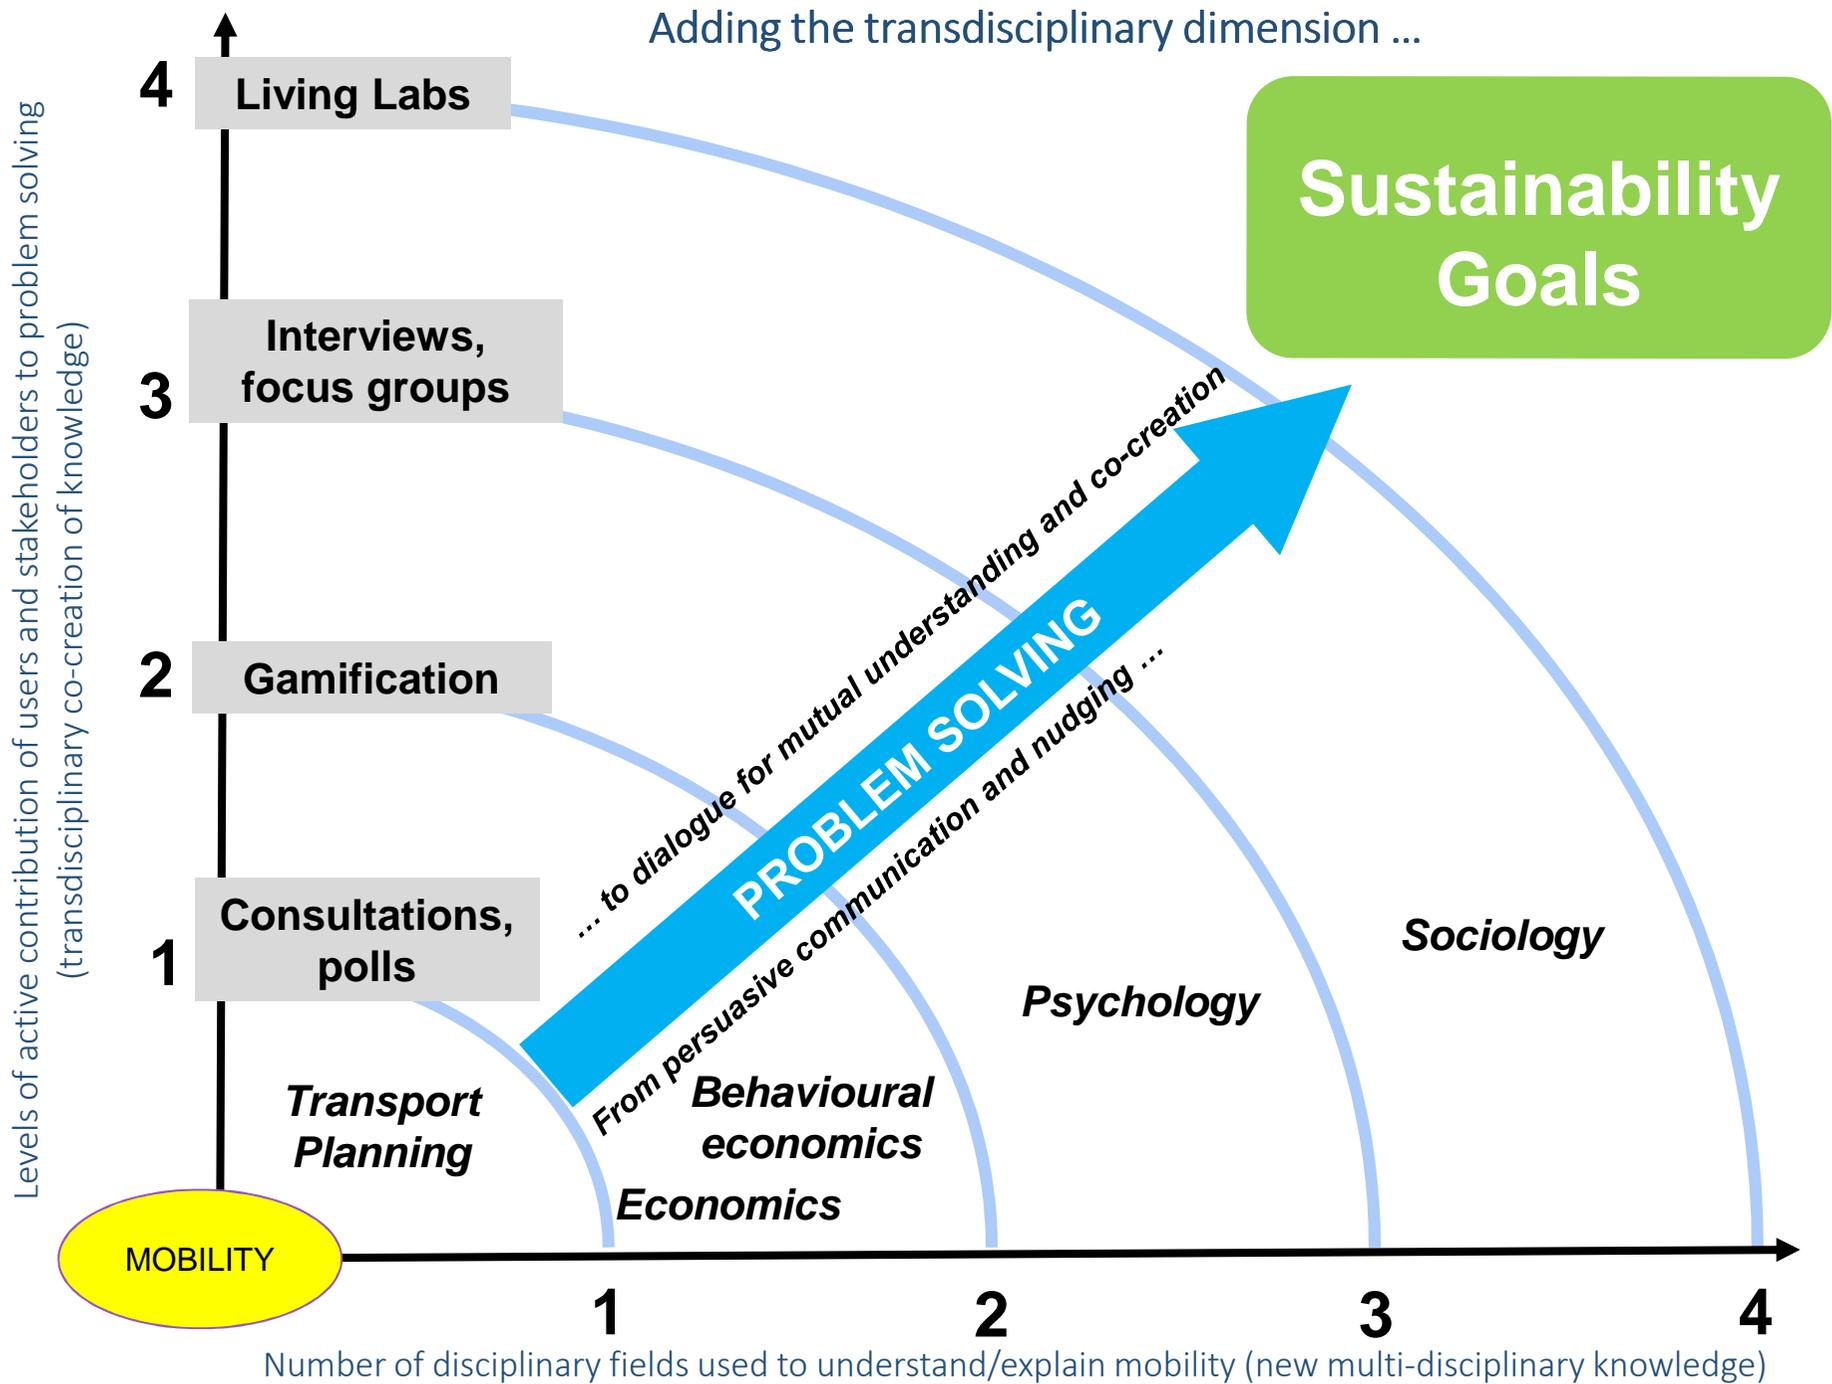

Translational research applies findings from basic science to enhance human health and well-being. In a medical research context, it aims to "translate" findings in fundamental research into medical and nursing practice and meaningful health outcomes. Translational research implements a “bench-to-bedside”, from laboratory experiments through clinical trials to point-of-care patient applications, model, harnessing knowledge from basic sciences to produce new drugs, devices, and treatment options for patients. The end point of translational research is the production of a promising new treatment that can be used with practical applications, that can then be used clinically or are able to be commercialized.

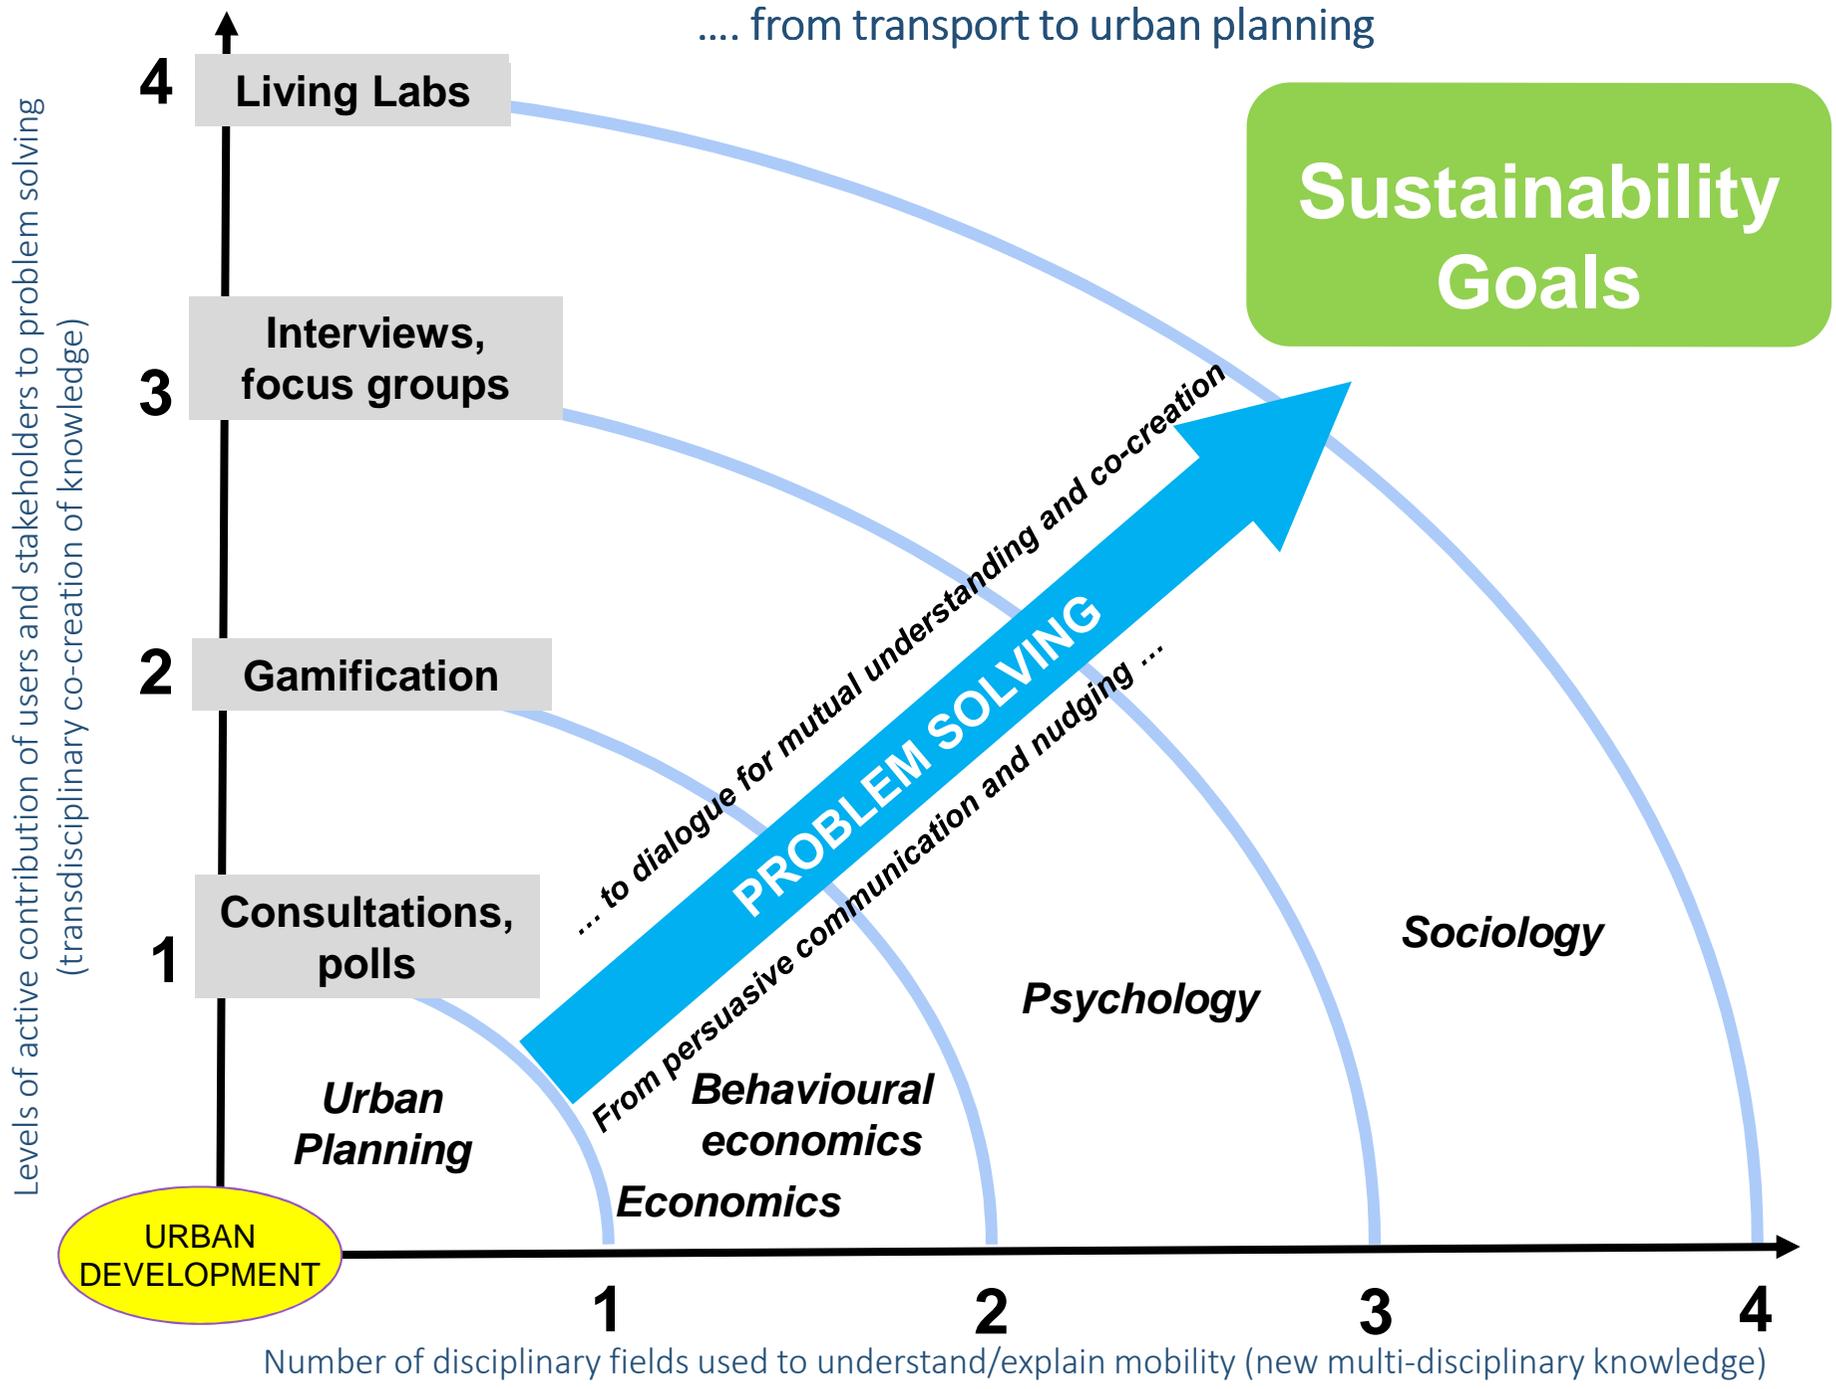

TRANSDUCE THE “TRANSLATIONAL BLOCKS” CONCEPT TO URBAN STUDIES ...

Health Studies	Urban Studies
<ul style="list-style-type: none">• T1: Transfer of new understandings of disease mechanisms gained in the laboratory into the development of new methods for diagnosis, therapy, and prevention and their first testing in humans.• T2: Translation of results from critical studies into everyday clinical practice and health decision making.	<ul style="list-style-type: none">• T1: Transfer of new understandings about urban systems and policy outcomes gained in demonstration projects into the development of new urban management methods.• T2: Translation of results from critical studies into everyday planning practice and city decision making.

Multidisciplinary “vision”
of urban mobility

Persuasive Communication

- We know the story
 - The goal is to replace your (wrong) story with our (right) story
- Information deficit model of behaviour change

(Robinson, 2015)

Information Deficit Model

(Robinson, 2015)

Emergent Dialogue

- We don't know the story: need to collectively co-create it
- Focus is cultural change and changes in social practices and institutional rules

(Robinson, 2015)

Different Purposes

Persuasive Communication	Emergent Dialogue
<p>How to convey the correct story in ways that change individual or policy behaviour</p> <ul style="list-style-type: none">• Digital/new media, and art, seen as exciting new tools for this	<p>Support innovation, creativity and adaptive response</p> <ul style="list-style-type: none">• Focus on possibility/opportunity (not crisis)• Allow participants to explore preferred outcomes and strategies for change, informed by understanding of the consequences of choices

Collective
Consensus

No Collective
Consensus

(Robinson, 2015)

Inter/Transdisciplinarity and Sustainability

- Both qualitative and quantitative focus
- Reach horizontally across disciplines but also vertically to society: co-creation of knowledge
- Recognize barriers: slower; less prestigious journals; more non-academic publications; dangers for junior faculty/grad students
- Need to institutionalize this type of work
- Connect to emerging inter-disciplines

(Robinson, 2015)

Interactive Sustainability Frontiers

Tools frontiers

- Landscape visualization
- Gamification
- Adaptive interface design (IFDM)
-

Process Frontiers

- Multiple channels: apps, games, social media, workshops, art
- Very large-scale engagement
- Windows of opportunity in political processes
-

(Robinson, 2015)

RRI CONCEPT – THE ESRI UK VISION

RESPONSIBLE RESEARCH INNOVATION IS (SHOULD BE):

- ✓ ANTICIPATORY (forward looking to societal and ethical implications)
- ✓ INCLUSIVE (engaging stakeholders and users)
- ✓ REFLEXIVE (primarily for the researchers to open their minds!)
- □ ✓ RESPONSIVE (to societal needs)
-

RRI DIMENSIONS

COMPARISON WITH THE CURRENT EC **SCIENCE WITH AND FOR SOCIETY** RRI FRAMEWORK

- **Public engagement:** engaging society more broadly with research and innovation.
 - **Gender equality:** ensuring gender equality in both the research process and research content
 - **Science Education:** promoting formal and informal science education
 - **Ethics:** taking account of the ethical dimension
 - **Open access:** In order to be responsible, research and innovation must be both transparent and accessible.
- **Methodologic/epistemic.** Proper use of the scientific method and sources of knowledge.
 - **Axiologic/ethical.** Connects research to system of values (e.g. Haidt, Moral foundations theory).
 - **Societal impact.** Takes into account the impacts it will have on nature and society.
 - **Inclusiveness.** Procedural (including citizens, women, being open etc.)
